

## **Telecommunications Safety**

April 9<sup>th</sup>, 2008

All telecommunication systems are interceptable. Communication privacy and secrecy don't exist. All messages transmitted through phone (land or cellular), facsimile and e-mail can be intercepted and recorded through sophisticated local and global systems. This means that each of our distance communications can be and really is violated.

Not just control systems on local knots but also Echelon, Sigint and several other satellite national or international systems are now functioning on global level. No communication can escape.

So we all must be aware that any call or message via fax or via the Internet is recorded and could be listened or read at any time from other subjects than the addressees. The selection of the messages is made by using key words for the written messages and by recognizing of vocal tones for sound messages.

There is no way to avoid interception; not even by adopting more complicated coding, ciphering or cryptography systems (also because they are all known). Once intercepted and recorded, each message can be deciphered and interpreted.

Therefore, not being able to prevent the identification of the means sending and receiving the messages nor to prevent cryptographic messages from being deciphered, the only way to guarantee absolute confidentiality is to prevent the recording of the content of the messages.

After years of researches and experimentations carried out under maximum secrecy out of the jurisdiction of any state, the way to prevent the recording of the content of the messages has been discovered. The method is and must remain secret. Implementing this discovery has conceived Delmex, a system that cancels the content of the messages transmitted by any communication channel from any part of the world before being listened to, read and recorded by unknown subjects.

Delmex doesn't prevent from identifying the transmission and receiving units but, independently from the means used to intercept, it makes simultaneous interpretation and recording of the content by third unknown parties impossible. So, the content of any distance communication remains secret. As it would be correct it was.

Delmex System will be activated in a very short time.
